            //decimingtore contribution and constant velocity. The bina was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (qi|q'32114|qb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored for ampicillin resistance."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/60 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (qil47321141gb]AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /strain="HM1:18S"

The driver was PCR-amplified cDNAs from pools of
using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (~2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

This sequence represents Thermomyces lanuginosus TL-gamma, a novel arth-dependent, plus end-directed microtubule motor protein that is a member of the unc-104 family and kinesin superfamily. The invention provides TL-gamma nucleic acids (see AAX87656), proteins and antibodies, and methods of screening for TL-gamma modulators potentially useful for treating hyphal fungal infections and diseases caused by mutated TL-gamma, e.g. neurodegeneration involving anterograde axonal transport, such as Alzheimer's, parkinson's or Huntington's diseases or amyotrophic lateral sclerois. Detection of TL-gamma allows differentiation between hyphal and non-hyphal lungal infections. Score 4030; DB 20; pred. DB 20;

The present invention describes the coding and protein sequences of the human kinesin-like protein HKLP. It is thought that the protein could be involved in neurological disorders, infertility, spontaneous abortion, neonatal chromosome disorders, aneuploidy and cancers. This is due to its function in the movement of microtubules. The protein shows homology to the murine KIFLA and KIFLB proteins. The sequences disclosed in the invention can be used in the isolation of similar human proteins and in vector production. In addition, the biallelic markers shown can be used in disease diagnosis and population studies.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous cof the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous cof system, such as peripheral nervous system diseases, such as alzaeiner's, Parkinson's disease, Huntington's disease, amycrophic contilisation of the activities such as: Immune system suppression, contilisation of the activities such as: Immune system suppression, continually inhibit activity, chemotactic/chemokinetic activity, heemostatic and thrombolyzic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and continual activity arthritis and inflammation, leukaemias and continual activity arthritis and inflammation, leukaemias and

[1] and the protein it encodes may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate KLIMP expression such as cancers, neurological disorders and disorders of vesicular transport. For example, [1] (and vectors containing [1] [1V) and the KLIMP polypeptide may be used to treat disorders associated with decreased KLIMP expression such as cancers (e.g. lymphoma, melanoma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid sequences encoding a human kinesin-like motor protein (KLIMP) useful for the treatment of diseases associated with inappropriate KLIMP expression such as cancers, neurological disorders and disorders of vesicular transport -

KLIMP and the corresponding polynucleotide are useful for diagnosis. treatment and prevention of disorders associated with decreased expression of KLIMP e.g. cancers (such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma, teratocarcinoma, and, in particular, cancers of the adrenal gland), neurological disorders (such as epilepsy, ischaemic cerebrovascular disease, stroke, cerebral neoplasms, Alzheimer's disease, Pick's disease, Huntington's disease, mental disorders), and disorders of vesicular transport (such as cancers), and disorders of vesicular transport (such as cytic fibrosis, diabetes mellitus, AIDS (Acquired Immune Deficiency Syndrome), viral, bacterial, fungal, helminthic, and protozoal infections).
                                                                                   leukaemia; lymphoma; melanoma; neurological disorder; epilepsy; ischaemic cerebrovascular disease; stroke; Alzheimer's disease; blick's disease; dementia; Parkinson's disease; vesicular transport disorder: cystic fibrosis; diabetes mellitus; AIDS; Acquired Immune Deficiency Syndrome; microbial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid sequences encoding a human kinesin-like motor protein (KLIMP) useful for the prevention and treatment of diseases associated with inappropriate KLIMP expression such as cancers and neurological disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          243
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            203 lgpyvedlsklavtdygdihdlidegnkartvaatnmnetssrshavftifftgrrhdlm 262

The invention relates to polynucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and proceds in volved in growth and development and receptors. (I) and can divolved in growth and development and receptors. (I) and sasociated with inappropriate DITHP expression. For example, (I) and (II) may be used to treat disorders associated with decreased polypeptide expression by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins or supplementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, cell proliferative disorder, corpured into the deficiency syndrome (AIDS), lymphoma, and be used to produce the DITHPs, by inserting the nucleic acids in complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in camples, and therefore which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of cantibodies against DITHPs and in assays to identify modulators of DITHP captobe used to down regulate expression and activity. The anti-DITHP actibodies and antagonists may also be used as diagnostic agents for detecting the presence of DITHPs in samples (e.g. by enzyme linked immunosorbant captobe the presence of DITHPs in samples (e.g. by enzyme linked immunosorbant captobe to the presence of DITHPs in samples of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention isseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                     652
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     602

The Arrivation of Arrivation of the Arrivation of the Arrivation of Arrivation of Arrivation and Arrivation of Arrivation and polypeptides homologous to them. Human secreted proteins have activities based on the tissues and cells the genes are expressed in.

Cathivities based on the tissues and cells the genes are expressed in. Camples of activities include: immunosuppressive; antiarthritic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; notropic; neuroprotective; antibacterial; virucide; fungicide; and ophthalmological. The polymucleotides and proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autonomine diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be used to also due to sunburn, to maintain organs before transplantation, for supporting cell outlure of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or the program of the parents of primary tissues, to regenerate tissues and in the exemplification of Arrestory the conditions of a pathological organs before transplantation of the program and the example of primary tissues, to regenerate tissues and in the exemplification of the arrest or discrete endocates expended as a food additive or the program and the condition of the arrest organs or decrease storage capabilities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAF22373 to AAF22421 encode the human secreted proteins given in AAB63134
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        306

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to AAB63182. AAB63183 to AAB63231 represent more human secreted proteins and polypeptides homologous to them. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive; antiarthritic; antitheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; antiproliferative; dynostatic; cardiant; vasotropic; fungicide; and ophthalmological. The polynucleotides and proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, malee, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted protein; diagnosis; immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fundicide; ophthalmological; gene therapy; autoimmune disease; neoplasm; rheumatoid arthritis; hyperproliferative disorder; cardiac arrest; cardiovascular disorder; cerebrovascular disorder; cerebrou ischaemia; anglogenesis; nervous system disorder; Alzhelmer's disease; infection; ocular disorder; corneal infection; wound healing; skin aging;

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression. Activinhibin activity, chemotactic/chemokinetic activity, heemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as a sasys for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-ocal interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The K39 polypeptide comprises a number of repeated units (described in AAR57366). Detection of antibodies directed against this repeated unit in a patients sample is indicative of leishmaniasis. The antigenic repeat unit can itself be used as a vaccine to protect against infection by a leishmania parasite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compounds including polypeptides that contain at least an epitope of the L. chaqasi acidic ribosomal antigen LCPO are useful in a variety of Immunoassays for detecting Leishmania infection. Portions of LCPO (AAT42164) contg. at least the 17 C-terminal amino acids (AAT42165) have been found to generate a signal in an ELISA that is equivalent to that generated by the full length LCPO. A combination polypeptide may also be used, comprising an LCPO epitope along with an epitope derived from the Leishmania K39 antigen (AAT42166), pref. the K39 repeat unit antigen having the sequence given in AAW03690.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      169 NPSTKG-----NLKVREHPSTGPYVEDLAKLVVRSFQEIENLMDEGNKARTVAATNM 220
